

In the Claims:

Please cancel Claims 37-44 and add new Claims 53-60, such that the claims are as set forth below.

Original Claims 1-26. (Cancelled)

27. (Withdrawn) A separation column comprising:  
a separation channel; and  
a fritless separation medium in the channel, said medium comprising a porous matrix, said porous matrix comprising a metal organic photopolymer.

28. (Withdrawn) The column of claim 27, wherein the separation channel has a channel wall, and the medium is attached to the channel wall and fills at least a section of the channel.

29. (Withdrawn) The column of claim 27, wherein the porous matrix is homogeneous and contains no chromatographic particles.

30. (Withdrawn) The column of claim 27, wherein a precursor of the photopolymer comprises a metal alkoxide.

31. (Withdrawn) The column of claim 30, wherein the metal alkoxide comprises a metal, and the metal is selected from the group consisting of aluminum, barium, antimony, calcium, chromium, copper, erbium, germanium, iron, lead, lithium, phosphorus, potassium, silicon, tantalum, tin, titanium, vanadium, zinc, and zirconium.

32. (Withdrawn) The column of claim 30, wherein the metal alkoxide comprises at least one photoactive group.

33. (Withdrawn) The column of claim 27, wherein the porous matrix has an affinity for an analyte.

34. (Withdrawn) The column of claim 27, wherein the separation medium comprises a homogeneous phase.

35. (Withdrawn) The column of claim 27, wherein the separation channel is a capillary separation channel or a planar structure.

36. (Withdrawn) A separation column comprising:  
a separation channel; and  
a fritless separation medium in the channel, said medium comprising a porous matrix, said porous matrix comprising a metal organic polymer.

37 - 44. (Cancelled)

45. (Withdrawn) A method of separating a sample of analytes, comprising:  
providing a separation column comprising a separation channel and a fritless separation medium in the channel, said medium comprising a porous matrix, said porous matrix comprising a metal organic photopolymer;  
introducing a sample of analytes carried in a solution through the column, wherein the medium concentrates the analytes on the column; and  
causing a solution to flow through the column, thereby separating and eluting the analytes.

46. (Withdrawn) The method of claim 45, wherein the introducing comprises applying a voltage or a pressure to the column.

47. (Withdrawn) The method of claim 45, wherein the introducing comprises introducing a sample of analytes carried in a first solution through the column, and the causing comprises causing a second solution to flow through the column, wherein the first solution is the same solution as the second solution.

48. (Withdrawn) The method of claim 45, wherein the introducing comprises introducing a sample of analytes carried in a first solution through the column, wherein the first solution comprises an eluting solvent, and the causing comprises causing a second

solution to flow through the column, wherein the second solution comprising the eluting solvent, and a concentration of the eluting solvent in the first solution is less than a concentration of the eluting solvent in the second solution.

49. (Withdrawn) The method of claim 48, wherein the introducing comprises introducing a sample of analytes having an injection plug length greater than a length of the column.

50. (Withdrawn) The method of claim 45, wherein the introducing comprises causing sample stacking.

51. (Withdrawn) The method of claim 45, wherein the providing comprises providing a separation medium comprising a porous matrix without chromatographic particles.

52. (Withdrawn) The method of claim 45, wherein the providing comprises providing a separation column comprising a capillary or a planar structure.

53. (New) A method of preparing a porous matrix in a separation column, comprising:

providing a separation column;

providing an initial mixture of at least one porogen, at least one metal alkoxide, and at least one photoactive material selected from a group consisting of a photoactive group associated with the metal organic monomer, a photoinitiator, and any combination thereof, such that a resulting mixture that results from said initial mixture comprises a metal organic compound;

introducing the resulting mixture into the column; and

irradiating the resulting mixture to form, via photoinitiated polymerization, a fritless, porous matrix comprising a metal organic polymer in the column.

54. (New) The method of claim 53, wherein the matrix contains no chromatographic particles.

55. (New) The method of claim 53, wherein the photoactive group is a methacrylate.

56. (New) The method of claim 53, wherein the porogen is selected to controllably form pores in the matrix.

57. (New) The method of claim 53, further comprising selecting a molar ratio of monomer to porogen to form pores in the matrix.

58. (New) The method of claim 53, wherein the irradiating comprises irradiating the mixture with visible or ultraviolet light.

59. (New) The method of claim 53, further comprising, after the irradiating, introducing an organic solvent into the column.

60. (New) The method of claim 53, wherein the providing comprises providing a capillary or a planar structure.
